According to our (Global Info Research) latest study, the global Space Resource Exploration Services market size was valued at US\$ 146 million in 2025 and is forecast to a readjusted size of US\$ 454 million by 2032 with a CAGR of 17.6% during review period.

Space resource exploration services refer to a professional service system comprised of commercial space companies, research institutions, or integrated space service providers. This system utilizes satellite remote sensing, deep space probes, lunar and asteroid probes, orbital robots, and related data analysis technologies to explore, identify, assess, and model exploitable resources in the Moon, asteroids, Mars, and other celestial bodies. Its core objective is to identify and quantify potential exploitable resources, including water ice, helium-3, rare metals, rare earth elements, and other strategic minerals, providing data support and a technological foundation for future space mining, on-orbit resource utilization (ISRU), and deep space economic activities.

With the accelerated commercialization of global spaceflight, the continuous reduction in launch costs driven by companies like SpaceX and Blue Origin, and the advancement of lunar base and deep space exploration programs by countries such as the United States, the European Union, China, and Japan, space resource exploration services are gradually shifting from a research-driven to a commercially driven model. In the next 10-20 years, this industry will become a crucial upstream link in the "space economy," providing critical data support for subsequent lunar mining, on-orbit manufacturing, and deep space energy supply. In particular, lunar water ice, asteroid metal resources, and space energy resources are considered to have long-term strategic value, making space resource exploration services a core infrastructure link connecting "deep space

exploration" and "commercial development." In the long run, this industry is expected to form an important part of a trillion-dollar space economy system, together with satellite remote sensing, space logistics, and orbital manufacturing.
