Abstracts

The global Space Weather Data Service market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Space weather data services refer to meteorological and atmospheric data collected from satellites, aircraft, ground observation stations and other sensor sources, usually including temperature, humidity, wind speed and direction, precipitation, cloud conditions and other information. These data are used in weather forecasting, weather monitoring, meteorological research, environmental monitoring and multiple other applications. Space weather data are typically acquired through remote sensing technology, weather satellites, and atmospheric sounding instruments, and are then processed and distributed by weather agencies, research institutions, and commercial providers. As satellite and sensor technology continues to develop, the future trend will be to provide higher resolution and more real-time meteorological data. This will help improve the accuracy of weather forecasts and respond to natural disasters and extreme weather events.
