According to our (Global Info Research) latest study, the global Spacecraft Magnetometer market size was valued at US\$ 9.4 million in 2024 and is forecast to a readjusted size of USD 13 million by 2031 with a CAGR of 4.7% during review period.

A spacecraft magnetometer is an instrument used to measure magnetic fields in space, typically mounted on spacecraft to study the magnetic environment around planets, moons, the Sun, or interplanetary space. These devices help scientists understand planetary magnetic fields, solar wind interactions, and space weather phenomena. Magnetometers can detect the strength and direction of magnetic fields, often using highly sensitive sensors like fluxgate, optically pumped, or superconducting types. To minimize interference from the spacecraft itself, magnetometers are usually placed on long booms away from the main body. Their data is crucial for missions in planetary science, heliophysics, and astrophysics.
