Abstracts

The global Special-Fumed Silica for Defoamer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

With its high adsorption capacity, the special/fumed silicon dioxide used in the defoamer can effectively absorb the bubbles in the liquid and prevent them from aggregating and producing excessive foam. They disperse evenly in liquids and act as a defoamer, thereby providing a clean, foam-free working environment. Defoamers are widely used in various fields. When selecting a suitable defoamer, liquid properties, process requirements, environmental and safety factors need to be considered.

Special/fumed silica for defoamers are active ingredient materials. The special silica is a porous material with large specific surface area and high adsorption capacity. It can absorb bubbles in the liquid and reduce its surface tension, thereby destroying the stability of the bubbles and achieving the purpose of eliminating or reducing the bubbles. The fumed silica adopts the sol-gel process, and the gas-solid phase precipitation is generated by controlling the gas-phase reaction to obtain silica particles with fine particle size and high specific surface area.
