## Abstracts

According to our (Global Info Research) latest study, the global Special Interface market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Special interface is an interface that connects a specific type of integrated circuit (IC) chip to a specific application or product. A special interface can have different functions, features, or protocols than a standard interface. For example, an application-specific integrated circuit (ASIC) is an IC chip customized for a particular use, such as a chip designed to run in a digital voice recorder or a high-efficiency video codec. An ASIC can have a special interface that allows it to communicate with other components or devices in the system. Another example is an application-specific standard product (ASSP) which is an IC that implements a specific function that appeals to a wide market, such as a chip that performs audio processing or wireless communication. An ASSP can also have a special interface that enables it to perform its function efficiently and reliably.
