## Abstracts

The global Special Interface market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Special interface is an interface that connects a specific type of integrated circuit (IC) chip to a specific application or product. A special interface can have different functions, features, or protocols than a standard interface. For example, an application-specific integrated circuit (ASIC) is an IC chip customized for a particular use, such as a chip designed to run in a digital voice recorder or a high-efficiency video codec. An ASIC can have a special interface that allows it to communicate with other components or devices in the system. Another example is an application-specific standard product (ASSP) which is an IC that implements a specific function that appeals to a wide market, such as a chip that performs audio processing or wireless communication. An ASSP can also have a special interface that enables it to perform its function efficiently and reliably.
