Abstracts

According to our (Global Info Research) latest study, the global Specific Absorption Rate (SAR) Testing market size was valued at US\$ 98 million in 2024 and is forecast to a readjusted size of USD 120 million by 2031 with a CAGR of 3.0% during review period.

Specific Absorption Rate (SAR) testing is a measurement process used to evaluate the rate at which radiofrequency (RF) electromagnetic energy is absorbed by the human body when exposed to wireless devices, such as cell phones, tablets, and other wireless communication devices. The SAR value is a crucial parameter in assessing the potential health effects of radiofrequency radiation on human tissues and ensuring the safety of wireless devices.

With the deployment of 5G networks, SAR testing has adapted to account for the higher frequencies and complex modulation schemes associated with 5G technology. Testing standards have been updated to ensure accurate SAR assessments for 5G-enabled devices.
