A specific gravity analyzer is a device used to measure the density of a sample compared to the density of a reference substance, usually water. It typically works by measuring the buoyancy force exerted on a small object suspended in the sample, which can be used to calculate the density of the sample. These devices are commonly used in a variety of industries, including chemical processing, food and beverage production, and petroleum refining. They are often used to monitor the quality of raw materials, verify the concentration of solutions, or determine the density of fuels or other liquids.
