The global Spectral Color Luminance Meter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A spectral color luminance meter is an instrument used to measure the spectral distribution and brightness of a light source. It can evaluate the color performance and brightness performance of a light source by measuring the spectral energy distribution and brightness of the light emitted by the light source. Spectral color photometers usually consist of an optical system and a spectral measurement device. The optical system is used to collect the radiant energy emitted by the light source and focus it onto the spectrum measurement device. Spectral measurement devices can use different technologies, such as photodiodes, photoresistors or spectrometers, to measure the spectral distribution and brightness of light emitted by a light source. Through the analysis of spectral data, parameters such as color temperature, color index and brightness of the light source can be calculated.
