A robot speed reducer, also known as a robotic speed reducer or speed reducer for robots, is an intermediate device which connects a servo motor and actuator. The robot speed reducer is able to slow down an industrial robot by extracting the power generated by the servo motor in high-speed rotation via the pinion on the input shaft that meshes with the gear wheel of the output shaft in order to deliver substantial torque.

Industrial robots require highly efficient speed reducers with specific respect to high precision, lead time and service life, all of which are often the most challenging technical obstacles faced by the core components.
