Spent Foundry Sand, also known as used or waste foundry sand, refers to the sand that has been utilized in the foundry industry for the production of castings and has subsequently been discarded after its initial use. This sand, typically composed of silica (quartz) or a blend of silica with other minerals, is mixed with binders and additives to create a moldable material that can withstand the high temperatures and pressures involved in the casting process. Once the casting is completed and removed from the mold, the spent foundry sand is no longer suitable for reuse in its original form due to the presence of contaminants such as metal oxides, carbon, and residual binders.
