According to our (Global Info Research) latest study, the global Spent Fuel Shielding Tank market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Dry storage barrels are a way to store highly radioactive nuclear waste, such as spent fuel that has been cooled for at least a year. So-called 'storage drums' are generally steel containers, either welded or fastened with bolts. The spent fuel rods inside the barrel are in a chemically inert gas. No leakage is a basic requirement for storage tanks. There are also steel parts, concrete or other materials on the outside of the storage tanks to shield the radiation from the nuclear waste. Therefore, this design can be used for both storage and transportation.
