Abstracts

The global Spherical Alumina Filler market size is expected to reach \$ 592 million by 2032, rising at a market growth of 9.4% CAGR during the forecast period (2026-2032). Spherical alumina is a thermally conductive functional filler made of industrial alumina powder as raw material through multiple processes such as purification, dynamic combustion into balls, precision classification, surface modification, compounding, and homogenization. The physical and chemical properties of alumina powder are stable, strong adsorption capacity, high hardness, and the spherical structure makes it have a larger specific surface area and better fluidity.

China Dominates Production and Consumption: In 2024, China's spherical alumina output accounted for 72.84% of the global total, with a production value share of 47.49%. It is estimated that the production share will rise to 52.35% by 2031, making China the core hub of the global industrial chain. On the consumption side, China's consumption volume accounted for 54.42% of the world's total in 2024.

Product Driving Logic Shifts from 'General Demand' to 'High-end Upgrade': The core driver of industry growth has shifted from heat dissipation for traditional electronic components to rigid demand in high-end fields such as new energy vehicle powertrain systems, 5G base stations, and HBM packaging. In particular, as HBM technology evolves toward 16-layer stacking and 1.2TB/s bandwidth, it imposes stringent requirements on Low- γ spherical alumina in terms of ultra-low radioactivity, high sphericity, and high thermal conductivity, significantly raising the industry's technical threshold.
