According to our (Global Info Research) latest study, the global Spherical Alumina Filler market size was valued at USD 379.1 million in 2023 and is forecast to a readjusted size of USD 695.9 million by 2030 with a CAGR of 9.1% during review period.

Spherical alumina is a thermally conductive functional filler made of industrial alumina powder as raw material through multiple processes such as purification, dynamic combustion into balls, precision classification, surface modification, compounding, and homogenization. The physical and chemical properties of alumina powder are stable, strong adsorption capacity, high hardness, and the spherical structure makes it have a larger specific surface area and better fluidity.

Spherical alumina preparation process:

1. Ball milling method (high energy ball milling)

Ball milling is the most common method for preparing plagiarized alumina powder. The ball mill itself is a horizontal type, with a built-in steel ball grinding medium, so that after the material enters the cylinder, it will collide with the steel ball to produce an impact force to achieve a crushing effect. Adding grinding aids in the ball milling process can improve the uniformity of powder particle size.

2. Polymer network sol-gel method

Advantages: small particle size; disadvantages: poor sphericity

Global key players of Spherical Alumina Filler include Denka, Admatechs and Bestry Technology, etc. The top three players hold a share over 60%. Asia-Pacific is the largest market, has a share about 65%.
