According to our (Global Info Research) latest study, the global Spherical Mirrors market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Spherical mirrors are curved so that reflected beams converge on a focal point. Important parameters to consider when searching for spherical mirrors include diameter, radius of curvature, thickness, and focal length. The diameter of the mirror if viewed straight on can also be thought of as the height. If a mirror's curvature was extrapolated into a sphere, the radius of that sphere is the radius of curvature for that mirror. The thickness can be specified as center thickness or edge thickness. Focal length is the distance from the spherical mirror the light converges. Mirror material refers to the classification of the material used to make spherical mirrors. The material used influences the reflectivity characteristics of the spherical mirror. Choices include BK7 glass, copper, fused silica, nickel, optical crown glass, and UV grade fused silica.
