Abstracts

The global Spherical Molded Glass Lens market size is expected to reach \$ 478 million by 2032, rising at a market growth of 3.1% CAGR during the forecast period (2026-2032).

Spherical Molded Glass Lens refer to molded lenses made from optical glass as raw material, which are heated and softened, and then pressed and formed in a high-precision mold to obtain spherical curvature. Subsequently, annealing and coating processes are carried out to achieve the required surface shape accuracy and surface quality. Its advantages are good consistency, high batch efficiency, and strong environmental stability. It is commonly used in optical modules with relatively mild aberration correction requirements or prioritizing simple structure and cost efficiency. In 2025, global Spherical Molded Glass Lens production reached approximately 26 M Pcs, with an average global market price of around US\$ 13.65 per Pcs.

The demand for spherical glass molded lenses comes more from general imaging and lighting optics, some automotive and industrial sensing, and mass production projects that are more sensitive to cost and yield. However, in scenarios such as mobile phone cameras, high-resolution imaging in vehicles, and new sensing that pursue thinner, smaller, and higher imaging quality, the penetration rate of non spherical molded lenses is higher and continues to squeeze the share of spherical lenses in high-end applications. Therefore, spherical lenses are more likely to present a pattern of structural stability and local substitution, and growth mainly depends on the increase in usage in automotive and industrial applications, as well as the increment brought by new applications. High value increment tends to be more inclined towards non spherical surfaces and more complex surfaces.

This report studies the global Spherical Molded Glass Lens production, demand, key manufacturers, and key regions.
