The spherical splicing interferometer is an optical instrument that uses the principle of laser interference to perform high-precision surface topography measurement on large-sized spherical or aspherical optical components. The device acquires interference images from multiple viewing angles or local areas, and then reconstructs the three-dimensional topography of the entire measured surface through image stitching technology. It has the characteristics of non-contact, high resolution, and large measurement range, and is widely used in high-end manufacturing and scientific research fields such as aerospace, astronomical optics, and large mirror processing.
