Abstracts

The global Sphygmomanometers market size is expected to reach \$ 6425 million by 2032, rising at a market growth of 6.6% CAGR during the forecast period (2026-2032).

A blood pressure monitor is a medical diagnostic instrument that measures the systolic and diastolic blood pressure of the human arteries indirectly by applying pressure to the blood vessels through an inflatable cuff and combining auscultation or oscilloscopy methods. The upstream chain of this product mainly consists of high-precision pressure sensors, miniature inflation pumps, pressure relief solenoid valves, liquid crystal displays, main control microprocessor chips, polymer cuff fabrics, and rechargeable batteries, as well as other software and hardware component suppliers. The downstream part is distributed through medical device distributors, centralized procurement channels of various medical institutions, chain pharmacies retail terminals, and cross-border e-commerce platforms, ultimately reaching hospital clinical departments, health check centers, and the health management of ordinary residents' families. According to the operating data of this sub-segment of the global market in 2025, the total production capacity of blood pressure monitors worldwide is 165 million units. Against the backdrop of the steady release of chronic disease management and home care elderly care demands globally, the actual sales volume reached 142 million units that year. In terms of pricing, due to the inclusion of traditional mercury blood pressure monitors, electronic blood pressure monitors, and special dynamic blood pressure monitoring systems, the global market average price strictly remains at \$28 per unit. After deducting the procurement of core semiconductor components, channel promotion, and medical compliance certification investments, the average profit margin of this sub-sector currently remains at 16.5%.

In the future, blood pressure monitors will accelerate their evolution towards contactless

wearing, continuous non-invasive monitoring, cloud-based algorithms, and multi-parameter integration. By integrating Bluetooth and IoT modules, data will be synchronized in real time to hospital follow-up execution systems or family doctor terminals, achieving a transformation from a single measurement tool to a comprehensive health data terminal. Meanwhile, under the pressure of the global mercury-free policy, mercury sphygmomanometers are being completely replaced. In terms of market drivers, the expansion of the base of patients with chronic cardiovascular diseases caused by the intensification of global population aging is the most core and rigid driving force. In addition, the shift in public health awareness from passive treatment to active prevention, coupled with the in-depth penetration of smart healthcare in grassroots communities and remote home jogging management, has jointly shortened the equipment update cycle for C-end family users, and is strongly driving the continuous growth of the blood pressure monitor market sales.
