Spinal anaesthesia and lumbar puncture are medical procedures that involve the use of specialized needles to access the spinal canal. Spinal anaesthesia, also known as spinal block, is a technique where a needle is inserted into the subarachnoid space in the lower back to deliver local anesthetic agents, providing temporary pain relief or muscle relaxation for surgeries or childbirth. This procedure requires a fine, long needle, known as a spinal needle, which is carefully inserted to avoid damage to the spinal cord. On the other hand, a lumbar puncture, or spinal tap, involves using a needle to collect cerebrospinal fluid (CSF) for diagnostic purposes or to administer medications. The needle used for this procedure, often called a lumbar puncture needle, is also fine but designed to penetrate the dura mater to access the CSF while minimizing discomfort and risk to the patient. Both procedures require precision and care to ensure safety and efficacy.
