The global Spinal Interbody Fusion Cage market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A spinal interbody fusion cage is a medical device used to treat spinal-related diseases, especially spinal degenerative diseases and spinal fractures. Its main function is to stabilize the spine and promote the growth and healing of bone tissue by fixing and fusing the spinal bones. Spinal cages are typically made of metal and/or biomaterials and come in different shapes and sizes to accommodate different patient and surgical needs. It usually consists of the following components: 1. Screws or hooks: used to fix the position of the cage in the vertebral body and provide stability. 2. Connecting rods: Connect screws or hooks to form a continuous structure. 3. Bone graft material: usually the patient's own bone tissue or artificial bone substitute, used to promote the growth and fusion of bone tissue. 4. Cage shell: covered with bone graft material to protect and stabilize bone tissue. Spinal interbody cages are surgically implanted into a patient's spine to help restore stability and function to the spine. It is commonly used to treat conditions such as degenerative spinal diseases (such as lumbar disc herniation, scoliosis, etc.) and spinal fractures. After surgery, patients need recovery and rehabilitation exercises to promote the fusion of bone tissue and restore spinal function.
