Abstracts

According to our (Global Info Research) latest study, the global Spinal Machined Bone Allograft market size was valued at USD 547.4 million in 2023 and is forecast to a readjusted size of USD 693.9 million by 2030 with a CAGR of 3.4% during review period.

Demineralized bone matrix (DBM) is allograft bone that has had the inorganic mineral removed, leaving behind the organic 'collagen' matrix. It was first discovered by Marshall Urist in 1965 that the removal of the bone mineral exposes more biologically active bone morphogenetic proteins. These growth factors modulate the differentiation of progenitor cells into osteoprogenitor cells, which are responsible for bone and cartilage formation. As a result of the demineralization process, DBM is more biologically active than undemineralized bone grafts; conversely the mechanical properties are significantly diminished.

Factors such as the rising prevalence of spinal disorders and an increasing number of spinal surgeries are driving market expansion. Machined bone allografts offer several advantages, including structural stability, biocompatibility, and reduced risk of disease transmission. These factors have led to an increased adoption of machined bone allografts in spinal fusion procedures. Additionally, advancements in surgical techniques and the development of innovative machined bone allograft products further contribute to market growth. However, factors such as high costs associated with these products and the availability of alternative treatment options may restrain market growth. Overall, the spinal machined bone allograft market is poised for significant growth, driven by the increasing demand for effective spinal fusion solutions.
