Abstracts

The spindle bearing lubrication system consists of a high-pressure oil pump, an oil storage tank, a precision metering/injection valve block and a monitoring and control system. An oil pump delivers lubricating oil to the mixing block, and precision metering valves dispense precise amounts of oil into the pressurized air stream. The oil is converted into micro-droplets, which are fed into the spindle bearings. The control system determines how often the oil is circulated and monitors all functions for alarm conditions such as low oil level and low oil pressure. Not only does it provide the bearing with an optimal amount of oil, it also constantly removes contaminants from the bearing and cools the bearing. The result of these combined advantages is reduced bearing wear, extended spindle life and the ability to achieve maximum precision.
