The global Spiral Impurity Separator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Spiral impurity separator is a device used to separate solid particles of different densities or shapes in a slurry. It has two types: wet spiral separator and dry spiral separator.

The wet spiral separator is mainly used for beneficiation of heavy minerals such as coal, metal, ore sand, etc. It uses the density and hydrodynamic characteristics of particles to achieve separation. It consists of a tower structure around which is wound a flume with slots or channels at the bottom to extract settled solid particles. Particles of different densities and sizes settle at different speeds in the tank, enabling classification. The wet spiral separator can adjust the parameters such as cutting strip, washing water port and discharge port according to the needs to improve the separation efficiency.

Dry screw separators are mainly used to sort particles by shape, such as round and non-round. It consists of a tower structure with an inwardly sloping spiral around which a collecting funnel surrounds. Round particles, due to their higher rolling speed, are thrown out of the inner spiral and fall into the collection funnel, while non-round particles slide down the spiral.

The upstream industries of spiral impurity separator mainly include mining, metallurgy, chemical industry, papermaking and other industries, which need to use spiral impurity separator to purify or classify raw materials or intermediate products. The downstream industries of the spiral impurity separator mainly include building materials, environmental protection, agriculture and other industries, which need to use the spiral

impurity separator to process waste or recover useful substances.
