## Abstracts

According to our (Global Info Research) latest study, the global Spirometer market size was valued at USD 685.8 million in 2023 and is forecast to a readjusted size of USD 1114.1 million by 2030 with a CAGR of 7.2% during review period.

A spirometer is a device that gauges lung function by measuring the amount of air a patient is able to blow out of his lungs. A primary care physician or allergist may perform spirometry on a patient if he presents symptoms such as trouble breathing, wheezing, chest tightness or shortness of breath. Spirometers can measure 'forced expiratory volume', the amount of air that can be blown out of the lungs in a single second. Spirometers also measure 'forced vital capacity', the total amount of air a patient can expel from his lungs. These two measurements are then used to determine the total amount of air a patient can blow out in one breath.
