According to our (Global Info Research) latest study, the global Spirotetramat Technical market size was valued at US\$ 257 million in 2025 and is forecast to a readjusted size of US\$ 331 million by 2032 with a CAGR of 3.7% during review period.

Spirotetramat technical grade pesticide is an industrial-grade pesticide raw material made with spirotetramat as the active ingredient. It belongs to the tetramic acid insecticide class and is mainly used in the production of suspension concentrates (SC) and oil-dispersible suspensions (OD). Spirotetramat possesses unique bidirectional systemic properties, allowing it to be translocated within the plant through the xylem and phloem, effectively controlling piercing-sucking pests.

The upstream of the industry chain mainly includes suppliers of organic chemical raw materials, ketone compounds, nitrogen-containing intermediates, and pesticide intermediates. The midstream consists of spirotetramat technical grade manufacturers, who produce high-purity technical grade pesticides through multi-step organic synthesis processes and further process them into suspension concentrates (SC) and oil-dispersible suspensions (OD). The downstream mainly comprises pesticide formulation companies, agricultural input distributors, and growers, and it is widely used to control piercing-sucking pests such as aphids, whiteflies, scale insects, and psyllids on crops such as citrus, apples, grapes, cotton, vegetables, and potatoes.

In 2025, global sales of spirotetramat technical grade will reach 4,280 tons, with a production capacity of approximately 6,120 tons, an average selling price of US\$58,400 per ton, and an average gross profit margin of 25%-35%.

Spirotetramat is primarily used to control piercing-sucking pests such as aphids, whiteflies, psyllids, and scale insects, and is widely used in high-value crops such as citrus, apples, grapes, cotton, potatoes, and vegetables. Global demand mainly comes from the fruit and vegetable growing markets in North America, Europe, Latin America, and Asia. With the increasing prevalence of pest resistance and the expansion of cash crop cultivation areas, the market demand for spirotetramat, with its bidirectional systemic properties, continues to grow, making it one of the important products for controlling piercing-sucking pests.

Spirotetramat belongs to the tetramic acid derivative class of insecticides. Its mechanism of action is to inhibit lipid biosynthesis in pests, possessing a different site of action than traditional neonicotinoids and pyrethroids. In recent years, product development has shifted from single-agent formulations to compound formulations, such as combinations with abamectin, thiamethoxam, and imidacloprid, to improve the control spectrum and resistance management effectiveness.
