Abstracts

According to our (Global Info Research) latest study, the global Split NB-IoT Internet of Things Water Meter market size was valued at US\$ 647 million in 2024 and is forecast to a readjusted size of USD 881 million by 2031 with a CAGR of 4.5% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The split NB-IoT Internet of Things water meter is an intelligent metering device that separates the traditional mechanical water meter from the NB-IoT wireless communication module. It is designed for remote meter reading and smart water management. This water meter uses NB-IoT technology to transmit the real-time water consumption data of the water meter to the background system, realizing functions such as remote monitoring, prepayment management, abnormal alarm and data analysis. Its 'split' structure means that the metering module and the communication module are arranged separately. The communication module can be installed in a position with better signal, which solves the problem of poor communication in scenes such as underground pipelines and manhole covers. Compared with traditional water meters, this product has the advantages of low power consumption, wide coverage, stable data transmission and long life cycle. It is widely used in scenes such as urban residents, industrial parks, campuses and rural water supply transformation. It is one of the key terminal equipment in the construction of smart water and digital cities.
