According to our (Global Info Research) latest study, the global Split System Hot Water Heat Pump market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Split System Hot Water Heat Pumps use a refrigeration cycle to extract heat from the surrounding air. They then use a heat exchanger to heat water in an insulated storage cylinder. These systems typically use around 60 to 75% less electricity than a conventional electric hot water system. This is because the electricity is used to operate the heat pump and doesn't heat the water directly with an element. In split systems, the evaporator, fan and compressor are located in a separate unit and connected to the storage cylinder by refrigerant piping. The heated refrigerant gas passes through a heat exchanger located inside the cylinder to heat the water. They're quite similar to a split system air conditioner.
