Abstracts

According to our (Global Info Research) latest study, the global Split Type Ultrasonic Processor market size was valued at US\$ 2665 million in 2024 and is forecast to a readjusted size of USD 6155 million by 2031 with a CAGR of 13.0% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The split-type ultrasonic processor is an ultrasonic treatment device that employs a separated design for the ultrasonic generation unit and the transducer assembly. The ultrasonic generation unit, acting as the core for energy supply and control, is responsible for producing electrical signals of specific frequencies and power levels. The transducer assembly converts these electrical signals into mechanical vibrational energy efficiently through the piezoelectric effect and delivers the ultrasonic energy to the treatment medium via an adapted probe. This split structure allows flexible placement of the generation unit and transducer, accommodating diverse experimental space requirements while facilitating maintenance and upgrades. By precisely adjusting ultrasonic parameters (such as frequency, power, and treatment time), the split-type ultrasonic processor can achieve various functions, including sample dispersion, emulsification, extraction, and fragmentation. It finds extensive applications in fields such as materials science, biomedicine, and chemical engineering, providing an efficient and flexible technical means for ultrasonic treatment of complex systems.
