Surface plasmon resonance (SPR) is an optical-based, label-free detection technology for real-time monitoring of binding interactions between two or more molecules. A wide range of molecules can be studied, from ions and fragments to proteins and viruses. This innovative technology is capable of providing biophysical data such as affinity, kinetics and thermodynamics, in addition to answering basic questions of binding specificity and concentration.

Advancements in artificial intelligence (AI) and machine learning are increasingly being applied to enhance the performance and application possibilities of molecular interaction analyzers. These cutting-edge algorithms impart exceptional analytical capabilities, which significantly augment the speed, specificity, and interpretation of interaction data. This seamless integration of technology accelerates drug discovery processes and biomolecular research, demonstrating tremendous potential for transforming healthcare and life sciences sectors.
