Abstracts

The global Spray Carbon Black market size is expected to reach \$ 53.87 million by 2032, rising at a market growth of 3.9% CAGR during the forecast period (2026-2032).

In 2025, global sales volume of Spray Carbon Black was approximately 25,000 tons, with an average global market price of around USD 1,600 per ton. The gross margin of major producers in the industry was approximately 20%-35%.

Spray Carbon Black is a solid carbon black product produced from liquid hydrocarbons, coal-tar-based oils or other carbonaceous feedstocks through high-temperature cracking, incomplete combustion and spray-cooling processes. The product is generally supplied in powder or granular form and offers certain reinforcing, coloring, dispersibility and structural properties. It can be used to improve blackness, mechanical performance, processing properties and electrical conductivity or antistatic performance in rubber, plastics, coatings and inks. The term "spray" mainly refers to the production process and does not indicate that the product is a liquid spray.

The upstream raw materials for Spray Carbon Black mainly include coal tar, anthracene oil, ethylene tar, natural gas and other hydrocarbon feedstocks, as well as fuel, packaging materials and environmental treatment systems. The midstream consists of carbon black producers, which manufacture different grades of products through feedstock atomization, thermal cracking, cooling, collection, granulation and packaging. Downstream applications mainly include rubber products, coatings and inks, plastic modification and other industrial materials. The key value drivers lie in feedstock stability, particle size and structure control, impurity control, dispersibility and compatibility with downstream formulations.

This report studies the global Spray Carbon Black production, demand, key manufacturers, and key regions.
