Abstracts

The global Spring-applied Safety Brake market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Spring-applied safety brake is a type of braking system that is commonly used in machinery and equipment to provide a fail-safe braking solution. The brake uses a spring force to hold the brake in the engaged position, which means that the brake is applied when there is no power or hydraulic pressure available to the system. The spring-applied safety brake is designed to prevent accidents and ensure that the equipment stops quickly and safely in the event of an emergency. The brake is typically located on the output shaft of a motor or gearbox and is activated by a signal from a control system or an emergency stop button.
