## Abstracts

The global Spring-Loaded Electromagnetic Brake market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The spring-loaded electromagnetic brake is a dry friction brake that uses spring force and electromagnetic force to brake and release. Its working principle is: when the power is off, the spring force causes friction between the brake disc and the rotor, thereby braking the shaft; when the power is on, the electromagnetic force overcomes the spring force, causing the brake disc and rotor to disengage, thereby releasing the shaft. . Spring-loaded electromagnetic brakes have the characteristics of compact structure, stable braking torque, fast response speed and low noise. They are widely used in motors, lifting equipment, packaging machines, automatic doors and other fields.

This report studies the global Spring-Loaded Electromagnetic Brake production, demand, key manufacturers, and key regions.
