Abstracts

According to our (Global Info Research) latest study, the global Sputter Coating market size was valued at USD 7586.4 million in 2023 and is forecast to a readjusted size of USD 10190 million by 2030 with a CAGR of 4.3% during review period.

Sputter coating in scanning electron microscopy is a sputter deposition process to cover a specimen with a thin layer of conducting material, typically a metal, such as a gold/palladium (Au/Pd) alloy. A conductive coating is needed to prevent charging of a specimen with an electron beam in conventional SEM mode (high vacuum, high voltage). While metal coatings are also useful for increasing signal to noise ratio (heavy metals are good secondary electron emitters), they are of inferior quality when X-ray spectroscopy is employed. For this reason when using X-ray spectroscopy a carbon coating is preferred.

Global Sputter Coating key players include JX Nippon Mining and Metal, Tosoh SMD, Honeywell, Praxair, Umicore, etc. Global top five players hold a share about 50%.

Japan is the largest market, with a share about 35%, followed by North America and Europe, having a total share about 30 percent.

In terms of product, Metal and Element is the largest segment, with a share about 40%. And in terms of application, the largest application is Flat Panel Display, followed by Semiconductors, Solar Panel, Architectural Glass, etc.

The Global Info Research report includes an overview of the development of the Sputter Coating industry chain, the market status of Flat Panel Display (Metal and Element, Alloys), Solar Panel (Metal and Element, Alloys), and key enterprises in developed and
