According to our (Global Info Research) latest study, the global SQL In-Memory Database market size was valued at USD 5556.3 million in 2023 and is forecast to a readjusted size of USD 18930 million by 2030 with a CAGR of 19.1% during review period.

An SQL in-memory database is a type of purpose-built database that relies primarily on memory for data storage, in contrast to databases that store data on disk or SSDs. In-memory databases are designed to attain minimal response time by eliminating the need to access disks. Because all data is stored and managed exclusively in main memory, it is at risk of being lost upon a process or server failure. In-memory databases can persist data on disks by storing each operation in a log or by taking snapshots.
