Abstracts

According to our (Global Info Research) latest study, the global SR Latch market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The SR latch is a basic digital circuit element used to store the state of a bit (bit), its input includes two control signals S (Set, set to 1) and R (Reset, set to 0), and the output There are two output ports of Q and Q', where Q is the state of the output, and Q' is the complement of Q. The state of the SR latch can be changed by controlling the state of the input signal, so it can be used to store the state of a digital signal and maintain the state of the output when required. The state of the SR latch can be controlled with two inverting control inputs. When $S=1$, $R=0$, the output $Q=1$, $Q'=0$, which is called the set state (Set), that is, the state of the SR latch is '1'. When $S=0$, $R=1$, output $Q=0$, $Q'=1$, which is called reset state (Reset), that is, the state of the SR latch is '0'. When $S=0$, $R=0$, the output state of the SR latch is uncertain, which is called the forbidden state (Forbidden). When $S=1$, $R=1$, the state of the SR latch is invalid, that is, a state that should not appear, also known as a prohibited state. An SR latch usually consists of two cross-coupled gates, such as two cross-coupled NOR gates or two cross-coupled NAND gates, so it is also called a flip-flop. Since the SR latch has bistable characteristics, it can be used to realize various digital circuit elements, such as counters, registers, memories, etc.
