Abstracts

The global SSXO Oscillator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Spread Spectrum Crystal Oscillator (SSXO for short) is a special type of crystal oscillator used to generate spread spectrum signals. A spread-spectrum oscillator introduces a specific frequency modulation technique on the output signal, thereby broadening the spectrum of the signal to a wider frequency band. Spread-spectrum crystal oscillators usually use a quartz crystal as an oscillating element, and a specific spread-spectrum circuit is integrated in the oscillator circuit for frequency modulation. The spread spectrum circuit usually uses a pseudo-random sequence (Pseudo-Random Sequence) or a pseudo-noise (Pseudo-Noise) sequence as a modulation signal, and controls the spectrum broadening degree of the oscillator output signal by changing the frequency or amplitude of the modulation signal. Spread-spectrum crystal oscillators have many applications, such as in wireless communication systems for suppressing multipath interference and improving anti-interference performance, thereby increasing system reliability and capacity. In addition, spread spectrum technology can also be used to implement applications such as dynamic spectrum sharing and spectrum resource management. Spread spectrum crystal oscillators are widely used in some wireless communication systems, wireless sensor networks, radar, navigation, electronic countermeasure systems and other fields.
