Abstracts

According to our (Global Info Research) latest study, the global Stablecoin Infrastructure Software market size was valued at US\$ 440 million in 2025 and is forecast to a readjusted size of US\$ 710 million by 2032 with a CAGR of 7.1% during review period.

Stablecoin infrastructure software enables organizations to create, manage, distribute, and integrate stablecoins, a type of cryptocurrency, into financial and blockchain ecosystems. While stablecoin infrastructure software shares features of other cryptocurrency software, including cryptocurrency mining software and cryptocurrency payment gateways, it significantly differs. Stablecoins are created as a form of digital currency with the purpose of maintaining a stable value, rather than being valued on speculation. To achieve this, stablecoins are tied to real-world fiat currencies and assets, such as the US dollar (USD) or gold. Products in this category support core functions such as stablecoin issuance, smart contract deployment, reserve and collateral management, fiat on/off-ramps, wallet and payment integrations, cross-border remittances, and compliance with KYC/AML and audit requirements. Stablecoin infrastructure software is used by financial institutions, fintech institutions, blockchain developers, and enterprises seeking to offer programmable money, streamline digital payments, or build stable, interoperable assets on distributed ledgers.

The current market for AI appsec assistants is rapidly emerging alongside the widespread adoption of DevSecOps practices, with their role evolving from traditional passive vulnerability scanners into proactive security?? partners deeply embedded throughout the software development lifecycle. These assistants are required to provide real-time intelligent defect detection and immediate remediation suggestions during the coding phase, automatically generate security test cases and perform threat modeling

during build and test stages, continuously monitor runtime risks and orchestrate incident responses during operations, while also understanding business logic contexts to identify complex privilege abuse and business logic flaws that traditional rule-based approaches struggle to capture. The market as a whole exhibits parallel trends of 'shift-left' and 'adaptability,' meaning that tools must seamlessly integrate into IDEs, CI/CD pipelines, and cloud-native environments to achieve end-to-end security shift-left from development to deployment, while dynamically adjusting detection rules and priorities based on application behavioral changes rather than relying on fixed signature databases. At the same time, increasing user demands for alert accuracy and remediation actionability are driving the industry to shift from 'alert stacking' to 'precision-augmented decision-making,' enabling security assistants not only to 'find issues' but also to 'guide fixes,' thereby truly empowering development teams to deliver reliable applications at security speed.
