Abstracts

According to our (Global Info Research) latest study, the global Stacked Foil Capacitor market size was valued at US\$ 3237 million in 2025 and is forecast to a readjusted size of US\$ 4580 million by 2032 with a CAGR of 5.8% during review period.

A Stacked Foil Capacitor is a type of film capacitor in which multiple layers of dielectric film and metal foil electrodes are cut and stacked together to form a compact capacitor element. Unlike traditional wound film capacitors that use a rolled structure, stacked foil capacitors adopt a layered (laminated) structure, which provides lower equivalent series inductance (ESL), better current handling capability, and improved thermal performance. They are widely used in high-power and high-frequency applications such as DC-link circuits, inverters, motor drives, electric vehicles, and renewable energy systems. In 2025, global Stacked Foil Capacitor production reached approximately 1.43 billion units, with an average global market price of around 2.2 USD/unit. The production capacity for Stacked Foil Capacitor in 2025 was approximately 1.5 billion units. The typical gross profit margin for Stacked Foil Capacitor between 20% and 40%.
