## Abstracts

According to our (Global Info Research) latest study, the global Stacked Foil Material market size was valued at US\$ 665 million in 2025 and is forecast to a readjusted size of US\$ 1076 million by 2032 with a CAGR of 7.0% during review period.

Stacked Foil Material refers to a multilayer composite material made by alternately stacking metal foils (such as aluminum or copper) and dielectric films (such as polypropylene, polyester, or PPS), then laminating and encapsulating them into a compact structure. It is the core functional material used in stacked foil capacitors and high-performance film capacitors. This material provides excellent electrical stability, low loss, high ripple current capability, and long operational life, making it essential for power electronics systems such as inverters, electric vehicles, data centers, and industrial drives. In 2025, global Stacked Foil Material production reached approximately 43.1 km<sup>3</sup>, with an average global market price of around US\$ 15/m<sup>3</sup>. The production capacity for Stacked Foil Material in 2025 was approximately 45 km<sup>3</sup>. The typical gross profit margin for Stacked Foil Material between 20% and 40%.
