Stain-resistant fibers are textiles that have been specially treated or engineered to resist the absorption of liquids or contaminants that would typically cause stains. These fibers are designed to repel or make it easier to remove substances like food, drinks, oils, and dirt from the fabric, helping to maintain the cleanliness and appearance of the material over time. Stain resistance is typically achieved through: 1. Chemical Treatments: A protective coating is applied to the fibers, which prevents liquids and stains from being absorbed. 2. Fiber Construction: The fibers themselves may be manufactured with special properties, such as hydrophobic (water-repellent) characteristics, which naturally resist staining. These fibers are commonly used in clothing, upholstery, carpets, and various other fabric-based products where cleanliness and easy maintenance are essential.
