Surgical implant-grade stainless steel is a type of stainless steel specifically designed for use in medical implants, offering excellent biocompatibility, corrosion resistance, and mechanical strength. This steel is often subjected to special purification and surface treatments to ensure long-term stability inside the human body without causing adverse reactions. A common type is 316L stainless steel, which, due to its low carbon content and corrosion resistance, is widely used in the production of medical devices such as bone plates, screws, and joint prostheses. These materials provide long-lasting durability and safety for implants in complex bodily environments.
