Abstracts

The global Stainless Steel Disinfection Transfer Window market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Stainless steel disinfection transfer window is a type of straight through window commonly used in clean rooms and other controlled environments to promote material transfer between different areas while maintaining a sterile environment. Windows are usually made of stainless steel, which is a durable and easy to clean material that is resistant to corrosion and pollution. Windows are designed to be installed on walls or partitions between two areas, such as clean rooms and non sterile areas. Transfer windows usually have two doors, one on each side of the wall or partition. The doors are designed to be interlocked, so only one door can be opened at a time, which helps prevent pollutants from entering the clean room. Doors can also be equipped with locks or other safety features to ensure that only authorized personnel can enter the clean room. In addition to interlocking doors, transfer windows can also be equipped with disinfection systems such as UV-C lamps or hydrogen peroxide atomization systems to further reduce pollution risks.
