According to our (Global Info Research) latest study, the global Stainless Steel Kirschner Wires market size was valued at USD 26 million in 2023 and is forecast to a readjusted size of USD 32 million by 2030 with a CAGR of 3.3% during review period.

A kirschner wires (also called a K-wire) is a thin wire or pin that can be used to stabilize bone fragments. These wires can be drilled through the bone to hold the fragments in place. They can be placed percutaneously (through the skin), or can be buried beneath the skin.

Kirschner wires come in different sizes, and as they increase in size, they become less flexible. K-wires are often used to stabilize a broken bone, and then removed in the office once the fracture has healed.

The wires can also be threaded to help prevent movement or backing out of the wire, although that can also make them more difficult to remove.

Stainless steel Kirschner wires are orthopedic devices used for bone fixation. Market trends include the development of biocompatible coatings and improved wire designs to enhance surgical outcomes and patient recovery.
