Abstracts

The global Stainless Steel Pipe and Tube for Water Electrolysis Hydrogen Production market size is expected to reach \$ 227 million by 2032, rising at a market growth of 22.9% CAGR during the forecast period (2026-2032).

Stainless steel pipe and tube for water electrolysis hydrogen production refers to stainless tubular products installed in alkaline, proton exchange membrane, anion exchange membrane and solid oxide water-electrolysis units and their directly associated systems. These products convey purified water, alkaline electrolyte, hydrogen, oxygen, cooling media and instrumentation or sampling fluids. The product scope includes process pipe, precision and instrumentation tube, heat-exchanger tube, coiled tube and prefabricated tubular spools manufactured mainly from 304L, 316L, duplex stainless steel and high-alloy austenitic stainless steel. Global shipments of stainless steel pipe and tube for water electrolysis hydrogen production reached approximately 4,500 tonnes in 2025, with an average FOB price of approximately US\$11,500 per tonne and a manufacturing gross margin of approximately 20%-32%.

Demand is being driven primarily by the construction of large alkaline-electrolysis projects and the expansion of modular hydrogen-production systems. As individual electrolyzer capacity increases and multiple stacks are integrated into larger production trains, stainless tube demand is expanding beyond small instrumentation lines into module interconnections, electrolyte circulation, hydrogen and oxygen separation, purification and centralized cooling systems.

Grade 316L is expected to remain the principal material for hydrogen, oxygen, purified-water and PEM-system piping. Grade 304L is more widely used in lower-pressure

auxiliary circuits, while duplex and lean-duplex grades have potential in alkaline-electrolyte circulation and large heat-exchange systems. High-purity PEM applications place greater emphasis on internal surface roughness, particle control, bright annealing and electropolishing, resulting in significantly higher prices and margins for small-diameter BA and EP tubing than for conventional pickled process pipe.

The principal market risks are project delays, limited visibility into OEM procurement, price pressure from standardization and substitution by engineering polymers in selected low-pressure water circuits. Future competition will increasingly focus on material selection, precision tube processing, clean-surface treatment, prefabricated spools, modular tubing kits and just-in-time delivery rather than on commodity pipe tonnage alone.
