Abstracts

According to our (Global Info Research) latest study, the global Standard Power Management ICs market size was valued at US$ 42304 million in 2025 and is forecast to a readjusted size of US$ 70972 million by 2032 with a CAGR of 7.6% during review period.

Standard power management ICs are a category of standardized integrated circuits that provide power conversion, voltage distribution, sequencing control, status monitoring, and fault protection for electronic systems. Their core value lies in integrating functions that were previously discrete, such as buck conversion, boost conversion, linear regulation, load switching, charging, battery monitoring, and multi rail sequencing, into more compact, more efficient, and easier to deploy devices or platforms, thereby reducing bill of materials count, shrinking board area, simplifying power tree design, and improving reliability. This category includes both multi channel PMICs for processors, microcontrollers, memory, solid state drives, camera modules, and display modules, as well as standard power management devices for smartphones, wearables, industrial control, automotive cameras, ADAS, in vehicle infotainment, auxiliary energy storage units, and various adapters and fast charging power supplies. Its key technology paradigms typically include coordinated integration of multiple buck converters and LDOs, programmable or preconfigured sequencing control, low quiescent current, high frequency switching, low noise power delivery, over voltage, over current, and over temperature protection, and highly reliable designs oriented toward automotive grade and functional safety requirements. As end products continue to move toward higher integration, miniaturization, and lower power consumption, standard power management ICs are evolving from single regulators into system level power tree solutions for complete devices, and are delivered to OEMs, solution providers, module

makers, and automotive electronics customers through parametric product portfolios, reference designs, evaluation boards, long term supply programs, and local technical support, creating a business model centered on standard part number sales and supplemented by platform adoption and lifecycle services. In industry terms, this is both an important subsegment of analog and mixed signal semiconductors and a critical interface linking upstream wafer manufacturing with downstream system innovation efficiency.

The industry focus of standard power management ICs is shifting toward system-level power supply platforms that provide higher integration, stronger coordination, and lower development barriers around the complete power tree of end products. From Texas Instruments, Analog Devices, Renesas, ROHM, SG Micro, Southchip, Richtek, and Hynetek, an increasing number of products emphasize combinations of multi-channel Buck converters and LDOs, power-up sequencing control, fault monitoring, load switches, and direct adaptation to processors, memory, camera modules, and display modules. This indicates that when customers purchase standard power management ICs, they place greater emphasis on the reusability of the overall power architecture, design efficiency, and system reliability. For terminal device manufacturers, adopting standardized PMIC solutions can reduce the number of peripheral components, shorten debugging cycles, lower board-level area occupation, and achieve a better balance between miniaturization and low power consumption. Especially against the backdrop of continuously increasing device functions and continuously shrinking space, power management ICs are evolving from basic supporting components into key elements that affect overall device performance, thermal design, and time to market. This change essentially reflects an upgrade in terminal design methodology. In the past, customers could build the power tree one by one using discrete components. Today, however, processors, sensors, interfaces, and memory units require an increasing number of voltage rails, while power-on and sleep processes are becoming more complex. Relying solely on discrete solutions often means greater PCB layout difficulty, longer validation time, and higher failure risk. Therefore, PMICs that can standardize power supply, sequencing, monitoring, and protection into an integrated output are evolving from cost optimization tools into foundational platforms for shortening R&D cycles and improving mass production consistency. From the perspective of downstream demand structure, automotive electronics is becoming the most certain source of value growth for standard power management ICs. Official product information from Infineon, onsemi, Richtek, Southchip, Hynetek, and other manufacturers shows that in-vehicle cameras, ADAS, safety systems, and high-reliability body electronics are imposing higher requirements on multi-output capability, high frequency, low noise, and monitoring and protection functions, driving the continued enrichment of automotive-grade PMICs, automotive

LDOs, and automotive system power ICs. At the same time, mobile terminals and wearable devices remain the shipment base, with Samsung, Analog Devices, ABLIC, and other manufacturers continuing to optimize their Power IC and PMIC portfolios around size, efficiency, and quiescent current. Another growth line worth attention is power supply for processors, DDR, SSDs, and industrial control peripherals. The product directions of Texas Instruments, Renesas, SG Micro, Silergy, and Richtek all indicate that standard PMICs are penetrating more computing and storage platforms. Although different downstream sectors vary in terminal form, their technical requirements for power management are converging toward four directions: high integration, high efficiency, low noise, and high reliability. This gives standard power management ICs strong product reusability and cross-cycle resilience. Because downstream markets are expanding in volume while also increasing in complexity, this segment is not simply dependent on one terminal industry, but is benefiting simultaneously from the parallel expansion of automotive intelligence, industrial digitalization, edge computing, and high-density storage. In terms of regional competition, standard power management ICs still show a clear pattern of global multi-polar supply and concentrated application in Asia. U.S. and European manufacturers still have deep accumulation in platform-type PMICs, automotive-grade and functional safety products, high-end analog design methodologies, and global customer coverage. Japanese manufacturers maintain advantages in ultra-low power consumption, system power supply, and automotive electronics reliability, while Korean manufacturers have ecosystem synergy in mobile terminals, displays, and certain automotive display power supply applications. Meanwhile, manufacturers in mainland China and Taiwan are rapidly strengthening mid-to-high-end power management capabilities, extending from fast charging, display, and MCU power supply to automotive cameras, storage, and industrial scenarios, with clear improvements in product line completeness and local support capabilities. The policy environment is also generally positive. The United States and Europe continue to strengthen the resilience of their domestic semiconductor supply chains, while China continues to improve the design, validation, and adoption environment through integrated circuit industry promotion and the development of automotive chip standard systems. This also means that industry competition will gradually shift toward comprehensive competition in product portfolio, application understanding, reference design depth, and regional customer service capability. Companies that can cover multiple consumer, industrial, and automotive scenarios on the same platform, and that can provide more mature evaluation boards, design documents, and local FAE support beyond standard part numbers, will be more likely to upgrade single-device sales into platform-based customer relationships. In this sense, the optimistic outlook for the standard power management IC industry comes not only from the growth in terminal device volume, but also from the rising value density

brought by increasing single-device power complexity.

This report is a detailed and comprehensive analysis for global Standard Power Management ICs market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application. As the market is constantly changing, this report explores the competition, supply and demand trends, as well as key factors that contribute to its changing demands across many markets. Company profiles and product examples of selected competitors, along with market share estimates of some of the selected leaders for the year 2025, are provided.

Key Features:

Global Standard Power Management ICs market size and forecasts, in consumption value ($ Million), sales quantity (Million Units), and average selling prices (US$/Unit), 2021-2032

Global Standard Power Management ICs market size and forecasts by region and country, in consumption value ($ Million), sales quantity (Million Units), and average selling prices (US$/Unit), 2021-2032

Global Standard Power Management ICs market size and forecasts, by Type and by Application, in consumption value ($ Million), sales quantity (Million Units), and average selling prices (US$/Unit), 2021-2032

Global Standard Power Management ICs market shares of main players, shipments in revenue ($ Million), sales quantity (Million Units), and ASP (US$/Unit), 2021-2026

The Primary Objectives in This Report Are:

To determine the size of the total market opportunity of global and key countries

To assess the growth potential for Standard Power Management ICs

To forecast future growth in each product and end-use market

To assess competitive factors affecting the marketplace

This report profiles key players in the global Standard Power Management ICs market

+357 96 030922

based on the following parameters - company overview, sales quantity, revenue, price, gross margin, product portfolio, geographical presence, and key developments. Key companies covered as a part of this study include Chipown, Sino Wealth Electronic, Poweron, MR Semiconductor, Texas Instruments, MPS (Monolithic Power Systems), PI (Power Integrations), Silergy Corporation, On-Bright Electronics Incorporated, Hangzhou Silan Microelectronics, etc.

This report also provides key insights about market drivers, restraints, opportunities, new product launches or approvals.

Market Segmentation

Standard Power Management ICs market is split by Type and by Application. For the period 2021-2032, the growth among segments provides accurate calculations and forecasts for consumption value by Type, and by Application in terms of volume and value. This analysis can help you expand your business by targeting qualified niche markets.

Market segment by Type

AC-DC ICs

PFC ICs

PFM/PWM Control ICs

Others

Market segment by Product Type

PMIC

Charging Management IC

Battery Management IC

Display Power IC

Shanghai Awinic Technology Co., Ltd.

JoulWatt Technology Co., Ltd.

Richtek Technology Corporation

Global Mixed-mode Technology Inc.

Market segment by region, regional analysis covers

North America (United States, Canada, and Mexico)

Europe (Germany, France, United Kingdom, Russia, Italy, and Rest of Europe)

Asia-Pacific (China, Japan, Korea, India, Southeast Asia, and Australia)

South America (Brazil, Argentina, Colombia, and Rest of South America)

Middle East & Africa (Saudi Arabia, UAE, Egypt, South Africa, and Rest of Middle East & Africa)

The content of the study subjects, includes a total of 15 chapters:

Chapter 1, to describe Standard Power Management ICs product scope, market

+357 96 030922
info@marketpublishers.com

overview, market estimation caveats and base year.

Chapter 2, to profile the top manufacturers of Standard Power Management ICs, with price, sales quantity, revenue, and global market share of Standard Power Management ICs from 2021 to 2026.

Chapter 3, the Standard Power Management ICs competitive situation, sales quantity, revenue, and global market share of top manufacturers are analyzed emphatically by landscape contrast.

Chapter 4, the Standard Power Management ICs breakdown data are shown at the regional level, to show the sales quantity, consumption value, and growth by regions, from 2021 to 2032.

Chapter 5 and 6, to segment the sales by Type and by Application, with sales market share and growth rate by Type, by Application, from 2021 to 2032.

Chapter 7, 8, 9, 10 and 11, to break the sales data at the country level, with sales quantity, consumption value, and market share for key countries in the world, from 2021 to 2026.and Standard Power Management ICs market forecast, by regions, by Type, and by Application, with sales and revenue, from 2027 to 2032.

Chapter 12, market dynamics, drivers, restraints, trends, and Porters Five Forces analysis.

Chapter 13, the key raw materials and key suppliers, and industry chain of Standard Power Management ICs.

Chapter 14 and 15, to describe Standard Power Management ICs sales channel, distributors, customers, research findings and conclusion.
