A star tracker is an optical device used in spacecraft to determine its orientation by observing the positions of stars. It consists of a camera and a processing unit that captures images of the star field and compares them to an onboard star catalog to identify known stars. By calculating the relative positions of these stars, the star tracker can determine the spacecraft's precise attitude or orientation in space. This information is crucial for navigation, control, and stabilization of the spacecraft, ensuring accurate pointing of instruments and antennas. Star trackers are widely used in satellites, space probes, and telescopes for their high precision and reliability in the challenging environment of space.
