Abstracts

The starter ring gear is the component that is connected to the internal combustion engine, the part of the assembly that transmits torque from the starter motor to the engine's crankshaft in order to start the engine. The starter ring is usually made of medium carbon steel. The starter ring is attached to the flywheel or flex plate of the engine. The teeth of the ring gear are driven by the smaller gear (called the pinion) of the starter motor. The pinion only engages the starter ring during cranking, and once the engine is running, the pinion backs out.
