Abstracts

Static Charge Eliminators, also known as static Eliminators. The working principle of the Static Neutralization Equipment (Ionizer) is: the high-voltage generator and the discharge electrode generate a strong electric field between the discharge electrode and the ground electrode, the air molecules are ionized, and the tip of the discharge electrode alternately produces positive and negative ions. When the wind blows a large number of positive and negative ions to the surface of the object, Neutralize static electricity, or directly put the static eliminator close to the surface of the object to neutralize static electricity.

The primary function of an ionizer is to neutralize electrostatic charges on insulators and isolated (non-grounded) conductors to reduce the magnitude of electrostatic discharges in the ESD protected area. Point-of-use compressed air ionizers combat electrostatic attraction neutralizing charges on particles causing contamination or visual defects on products.
