Abstracts

The global Static configuration center sorting machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The static distribution center sorting machine is an automated sorting equipment commonly used for drug sorting and distribution in hospitals, pharmacies, and other places. It can automatically sort out drugs based on different medical orders and drug information, reducing manual operation time and error rates, and improving the efficiency and accuracy of drug distribution. The static distribution center sorting machine usually consists of a computer control system, conveyors, sorting machines, palletizing machines, etc. When in use, the drugs are placed in the bins of the sorting machine and then transported to the sorting machine through a conveyor. The sorting machine sorts the drugs into the corresponding bins according to preset procedures and rules. After sorting is completed, the palletizer will stack the drugs in the corresponding positions, waiting for further processing and delivery. The application of static dispensing center sorting machines can greatly improve the efficiency and accuracy of drug distribution, reduce manual operation time and error rates, and also reduce the costs and risks of medical institutions.
