The global Static Differential Pressure Transducer market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

A Static Differential Pressure Transducer is a type of pressure sensor used to measure the difference in pressure between two points where neither point is at zero pressure. This type of transducer is designed to measure the static pressure difference, as opposed to dynamic pressure changes resulting from airflow or fluid flow.

Static differential pressure transducers are commonly used in applications where accurate measurement of pressure differentials is required, such as in HVAC systems, cleanrooms, pharmaceutical manufacturing, and industrial processes.
